

Concept Note #16

PHP Edit and Remove Data

Updating Database Table

Step 1: Creating the HTML Form

The UPDATE statement is used to change or modify the existing records in a database table. This statement is typically used in conjugation with WHERE clause to apply the changes to only those records that matches specific criteria.

The basic syntax of the UPDATE statement can be given with:

UPDATE table_name SET column1 = value, column2 = value2, WHERE column_name = some_value

Let's make a SQL query using the UPDATE statement and WHERE clause, after that we will execute this query through passing it to the PHP `mysqli_query()` function to update the tables records. Consider the following sample table inside the sample database:

				id	first_name	last_name	email
☐				1	Miguel	Batong-bakal	ironmigz@gmail.com
☐				2	Juan	Dela Cruz	dckimsy@gmail.com
☐				3	Maria	Palma	mariapalm@gmail.com
☐				4	Miguel	Batong-bakal	ironmigz@gmail.com

 ☐ Check all With selected:  Edit  Copy  Delete  Export

The PHP code in the following example will update the email address of a person in the sample table whose id is equal to 1.

```
<?php
$link = mysqli_connect("localhost", "root", "", "sample");

if ($link === false) {
    die("ERROR: Could not connect." . mysqli_connect_error());
}

$sql = "UPDATE sample SET email = 'dcjuan@gmail.com' WHERE id =2";

if(mysqli_query($link, $sql)) {
    echo "Records were updated successfully";
} else {
    echo "ERROR: Could not able to execute $sql." . mysqli_errno($link);
}
mysqli_close($link)
?>
```

Deleting Database Table Data

Just as you insert records into tables, you can delete records from a table using the SQL DELETE statement. It is typically used in conjunction with the WHERE clause to delete only those records that matches specific criteria or condition.

The basic syntax of the DELETE statement can be given with:

DELETE FROM table_name WHERE column_name = some_value

Let's make a SQL query using the DELETE statement and WHERE clause, after that we will execute this query through passing it to the PHP `mysqli_query()` function to delete the tables records. Consider the following sample table inside the sample database:

				id	first_name	last_name	email
☐	Edit	Copy	Delete	1	Miguel	Batong-bakal	ironmigz@gmail.com
☐	Edit	Copy	Delete	2	Juan	Dela Cruz	dcjuan@gmail.com
☐	Edit	Copy	Delete	3	Maria	Palma	mariapalm@gmail.com
☐	Edit	Copy	Delete	4	Miguel	Batong-bakal	ironmigz@gmail.com
☐	Edit	Copy	Delete	5	Lex	Ilore	ilorelex@gmail.com
	☐ Check all	With selected: Edit		Copy		Delete	Export

The PHP code in the following example will delete the records of those persons from the sample table whose first_name is equal to Lex.

```
<?php
$link = mysqli_connect("localhost", "root", "", "sample");

if ($link === false) {
    die("ERROR: Could not connect." . mysqli_connect_error());
}

$sql = "DELETE FROM sample WHERE first_name = 'Lex'";

if(mysqli_query($link, $sql)) {
    echo "Records were deleted successfully";
} else {
    echo "ERROR: Could not able to execute $sql." . mysqli_error($link);
}
mysqli_close($link)
?>
```
