

Concept Note #17

PHPMyAdmin Settings

phpMyAdmin is an open-source software tool introduced on **September 09, 1998**, which is written in PHP. Basically, it is a third-party tool to manage the tables and data inside the database. phpMyAdmin supports various types of operations on **MariaDB** and **MySQL**. The main purpose of phpMyAdmin is to handle the administration of MySQL over the web.

It is the most popular application for MySQL database management. We can create, update, drop, alter, delete, import and export MySQL database tables by using this software. phpMyAdmin also supports a wide range of operation like **managing databases, relations, tables, columns, indexes, permissions, and users, etc.** on MySQL and MariaDB. These operations can be performed via user interface, while we still have the ability to execute any SQL statement.

MODIFYING TABLE COLUMNS IN PHPMYADMIN

1. Select the database you want to work with (by clicking on database name in the left column of the phpMyAdmin home page)
2. Once inside a database, you will see a list of tables. Click on the table you wish to modify.
3. Inside the table, you will see a list of columns. To the right of the column name, you will see a link called **"Change"** under the **"Actions"**. Click on the change link for the column you wish to modify.
4. You can change a variety of things, including the name of the column, length of the field (maximum number of characters allowed), default value, and more.
5. Once you are ready to proceed, click on **Save** to save the changes.

The changes you requested will have been changed.

EXPORT

1. Select your database from the list on the left,
2. Click on **"Export"** from the top set of tabs.
3. Select the tables from the list that you would like to back up. If you want to back up the entire database, click **"Select All"**.
4. Make sure both the **"Structure"** and **"Data"** boxes are selected on the right. They should be, by default.

In the structure section, check the **"AD DROP TABLE / DROP VIEW"** box if you want this export to be able to replace existing tables of the same name. If you want to merge this backup with another database, do not select this.

5. Check the **"Save as file"** box. Also select a compression option (such as **"zipped"**) if you want to compress the backup before downloading it from the server.
6. Click the **"Go"** button, and at the prompt, save the file to your local computer.

IMPORT

1. Make sure the database you need has already been created. If it has not, please first create the database.
2. **CAUTION:** if you import a backup file to database that already has content, it will replace the existing content.
3. In phpMyAdmin, select your database from the list on the left.
4. Click on **"Import"** from the top set of tabs.
5. Click on the **"Browse"** button next to **"Location of the text file"**.
6. Browse to your local SQL file and click **"Open"** if it is zipped file, please unzip the file first.
7. Click on the **"Go"** button at the bottom. Wait while your database imports. Depending on the size, this can take a few minutes.

You should get a message like this: Import has been successfully finished, X queries executed.

RENAME A DATABASE

1. Click on the database you wish to rename in the left-hand column.
2. Click on the **"Operations"** tab.
3. Where it says **"Rename database to"** enter the new database name.
4. Click the **"Go"** button.
5. When it asks you to want to create the new database and drop the old database, click **"Ok"** to proceed. (This is a good time to make sure you spelled the new name correctly).
6. Once the operation is complete, click **"Ok"** when asked if you want to reload the database.

DELETE A DATABASE IN PHPMYADMIN

Go to the **phpMyAdmin** home page and select the database which you want to delete. Now select operations and click on drop the database.
